

Painter's Tape Caution!

While painter's tape is designed to be gentle on most surfaces, including painted walls and trim, there is a possibility that some brands may cause staining or damage to certain cabinet finishes.

Cautionary Guidelines:

1. Test in an inconspicuous area: Before applying painter's tape to any cabinet surface, we recommend conducting a test in a small, inconspicuous area to ensure compatibility with the finish. This will help you determine whether the tape can be safely used on your specific cabinet doors.
2. Remove tape promptly: If you decide to use painter's tape on your cabinets, please ensure that it is removed promptly. Prolonged exposure to the adhesive will increase the risk of staining.

Disclaimer:

While painter's tape is widely used for various painting applications, we cannot guarantee its compatibility with all cabinet finishes. Therefore, any damage caused using painter's tape on cabinet doors along with any other finished components is not covered under our warranty.
